

Globally Recognised Training for CR Asia Bolting Technicians

Established in 1991, CR Asia offers comprehensive maintenance services to customers in the Oil, Gas, Refining, Petrochemical, Power and other heavy industries across the whole of Asia. The company currently employs over 4,500 people across permanent facilities in Thailand, Singapore, Malaysia and India.

Industrial bolting is a key service offered by CR Asia to their clients and they pride themselves on delivering safer, faster and more efficient results on every project. To that end, CR Asia technicians were recently trained and certified to the globally recognised ECITB MJI standard.

Training was delivered at the Thai based training facility operated by LAPP UK partners SAP.

CR Asia Management commented: "The course was well organised and covered hand torqueing, hydraulic torqueing and hydraulic tensioning. Our technicians learnt how to use and apply a range of equipment along with good practices for assembly and disassembly and underwent written, fault detection and practical tests to demonstrate their competence.

With this training, our team is able to safely work with bolted joints and know the correct use and method of **torque tightening and bolt tensioning**. They understand the behaviour of bolts, nuts, gaskets and flanges and are well informed of the best practices for assembly and disassembly.

We recommend this training as it was very well organised, and we have all learnt a lot from it. We will also review our internal bolting course to improve the training for temporary employees."

Yet another great example of LAPP UK and their global partners leading the way in industrial joint integrity assurance.
